

EXPERIMENT 14:

The screenshot displays the Keil uVision IDE interface for a project named 'exp14'. The main window is divided into several panes:

- Registers:** A table showing the current state of the microcontroller's registers. The PC register is highlighted at address 0x00BEA, containing the value 759850.
- Disassembly:** Shows the assembly code for the selected instruction. The instruction is `MOV SCON, #0x50`, which is highlighted in yellow.
- exp14.c:** The C source code for the program. It includes a `main` function that initializes the UART module (SCON, TMOD, TH1, TL1, TR1) and enters a loop that prints "Hello World!" to the UART.
- Command:** A text area showing the command used to load the program: `Load "C:\Users\jahnavi kodavati\Downloads\Objects\exp14"`.
- UART #1:** A window showing the output of the UART. It displays the text "Hello World!" repeated multiple times, indicating that the program is successfully transmitting the message.

The status bar at the bottom indicates the current state of the program, including the address `0x00BEA` and the instruction `MOV SCON, #0x50`.
