

EXPERIMENT 15:

The screenshot displays a microcontroller development environment with the following components:

- Registers Window:** Shows the state of various registers. The 'Regs' section lists r0 through r7, all containing 0x00. The 'Sys' section shows PC at 0x0800, status at 369, and other system registers at 0x00.
- Disassembly Window:** Shows assembly instructions at addresses 13 and 14. Address 13: `B = 10;` followed by `MOV B(0xF0), #0x0A`. Address 14: `ACC = ACC / B;` followed by `DIV AB`.
- Source Code Window (exper15.c):** Contains C code for a parallel port experiment. It defines variables for hexa, hundreds, tens, and units. It sets B to 10, calculates ACC = ACC / B, and assigns units, tens, and hundreds based on the calculated values. It then assigns P0, P1, and P2 to units, tens, and hundreds respectively, and enters a `while(1);` loop.
- Parallel Port Windows:** Three floating windows show the status of Parallel Port 0, Parallel Port 1, and Parallel Port 2. Each window displays the port number, the current value (e.g., P0: 0x08), and a bit field representation.
